

STARTUP INVESTMENT ANALYSIS

Shark Tank India Dataset | Internship Project

1. Introduction

This project analyzes Shark Tank India startup investment data to understand investment patterns, deal outcomes, funding levels, valuation trends, and investor participation. The dataset contains 117 startup pitches and 28 attributes covering startup details, pitch requests, valuations, equity, deal amounts, and individual shark participation. Python is used for data inspection and analysis, while Tableau is used to communicate the findings through visualization.

2. Abstract

The project transforms structured startup investment records into measurable business insights. The dataset was inspected for data quality and then analyzed using funding, deal, valuation, and investor-participation metrics. The analysis identified 65 successful deals from 117 pitches, giving a deal success rate of 55.56%. Total recorded deal funding was ₹3,742.00106 lakhs and average funding was ₹31.98 lakhs. Shark-wise participation and multi-shark deal patterns were also examined. The outputs form the basis for an interactive Tableau dashboard and an investment-trend report.

3. Dataset and Tools Used

Item	Details
Dataset	Shark Tank India Dataset
Records	117 startup pitches
Attributes	28 columns
Programming	Python, Pandas, NumPy
Visualization	Tableau
Development	Jupyter Notebook

4. Data Preparation and Quality Assessment

- Inspected dataset dimensions, records, columns, and data types before analysis.
- Checked all columns for missing values; no missing values were found.
- Checked complete-row duplicates; no duplicate records were found.
- Verified numeric fields such as deal amount, valuation, equity, and investor indicators.
- Because the source data was already well structured, only minimal preprocessing was required.

5. Analysis Methodology

- Calculated total startup pitches, successful deals, total funding, and average funding.
- Calculated deal success rate as successful deals divided by total pitches.
- Aggregated individual shark deal columns to compare investor participation.
- Analyzed how many sharks participated in each startup deal.
- Ranked startups by deal amount to identify the highest-funded pitches.
- Prepared analytical outputs for Tableau visualization.

STARTUP INVESTMENT ANALYSIS

Results, Dashboard Plan and Conclusion

6. Key Results

Metric	Result
Total startup pitches	117
Successful deals	65
Deal success rate	55.56%
Total deal funding	■3,742.00106 lakhs
Average funding	■31.98 lakhs
Duplicate rows	0
Missing values	0

7. Investor Participation Findings

- Aman recorded 28 deals, followed by Peyush with 27, Anupam with 24, Namita with 22, Ashneer with 21, Vineeta with 15, and Ghazal with 7.
- The shark-collaboration distribution was: 52 startups with no investment, 22 with one shark, 20 with two sharks, 14 with three sharks, 5 with four sharks, and 4 with five sharks.
- Aas Vidyalaya had the highest recorded deal amount at ■150 lakhs. Annie recorded ■105 lakhs, while several other startups recorded ■100 lakh deals.

8. Tableau Dashboard Design

- KPI cards for total startups, successful deals, deal success rate, total funding, and average funding.
- Bar chart for shark-wise deal participation.
- Deal versus no-deal visualization.
- Horizontal bar chart for the top funded startups.
- Distribution chart for the number of sharks participating in deals.
- Ask amount versus deal amount comparison.
- Ask valuation versus deal valuation comparison.

9. Business Interpretation

The analysis shows that startup investment outcomes can be examined through several business dimensions: whether a pitch receives funding, the amount committed, the number of participating investors, and the relationship between requested and finalized deal terms. These measures provide a structured view of investor activity and startup funding behavior.

10. Conclusion

The Shark Tank India Startup Investment Analysis project demonstrates an end-to-end business analytics workflow from data inspection to decision-oriented visualization. Python was used for data quality validation, aggregation, KPI calculation, investor analysis, and exploratory analysis. The results are prepared for presentation through Tableau, allowing funding, deal success, investor participation, and startup-level patterns to be explored interactively. The project provides a clear foundation for understanding startup investment behavior from the available dataset.

Deliverables: Python/Jupyter analysis notebook, validated dataset, Tableau dashboard, investment-trend report, and founder/startup success-pattern summary.
